

# Know when synthetic users help, and when they'll fool you.

AI-driven product loops move too fast for traditional validation, creating a dangerous illusion of user certainty. Anchorflight is an interactive triage tool: in about two minutes it tells you exactly where synthetic cohorts are reliable, and exactly when you must halt the loop and bring in real humans.

## WHY "ANCHORFLIGHT"

The **flight** is your development velocity, the pace at which AI lets you build. The **anchor** is the empirical human data that keeps every synthetic pass grounded. Move fast, but stay tethered to real people where it counts.

## The Continuous-AI Loop Each stage is colored by who you can trust there.

### Triage gate — runs first, sets how hard the exit is

Reversible, low-stakes → loose exit · Irreversible, high-stakes → hard exit
